

# Network Projects

I like working with IP networks!

The purpose of this page is to document some of the fun

- to show some ideas about the basic functionality of IP networking
- to provide some "real life" numbers about performance
- to have fun using OpenBSD, FreeBSD, switches, firewalls and do some routing YEAH!

NB: You won't find any scientific hard evidence and the numbers are just for fun, There might be settings that can improve the performance of some experiments - if you find them please forward information and I might redo the experiment!

The menu on the left contains links to the experiments done and documented so far.
